

Master Build Directive: MCP Agent and Data System — New Platform Build

1. Controlling task

Build the complete agent and data system, connect it securely to the live MCP domain

`mcp.thewelllivedcitizen.co.com`, and prepare the real storage containers, automated workflows, routing, permanent agents, agent spaces, LLM, guardrails, live HTML dashboard/server, living context, files, photos, review states, and outputs so Dayna can begin dropping in files and photos for automatic handling.

This is the same system and the same end goal previously defined.

The platform changed. The task did not.

Build the system from scratch on the new platform.

Do not treat any previous platform implementation, deployment, repository architecture, database, storage service, server implementation, dashboard implementation, or infrastructure configuration as the implementation that must now be repaired, completed, migrated, reconciled, or continued.

Previous work is source material and reference material where useful. It is not the technical foundation of the new build merely because it already exists.

Do not reinterpret the platform change as a change to the product.

Do not reduce the build to a smaller prototype, a generic multi-agent demo, a registry of named agents, a dashboard mockup, a file organizer, a photo organizer, a local-only application, or one narrow workflow.

The build is larger than the permanent workforce alone.

The completed system includes, together:

- the MCP;
- the live server;
- the live HTML dashboard/workspace used by Dayna and the AI workers;
- the LLM layer;
- permanent LLM and agent guardrails;
- permanent occupational agents;
- qualified skills and tools;
- routing and orchestration;
- permissions and approvals;
- living context and corrections;
- evidence and provenance;

- storage containers;
- document intake and processing;
- photo and media intake and processing;
- automatic workflows;
- agent work queues;
- review and failure states;
- outputs and records;
- continuity and recovery;
- the connections required for Dayna and approved AI workers to use the system;
- hosting from Dayna's existing business domain.

The division of responsibility is:

Build the system and its workforce now. Dayna brings real work into the system after it is ready.

The system must already know how to receive work, identify the functions required, route it to qualified agents, apply the correct skills and tools, use the LLM within the permanent guardrails, preserve evidence and context, handle uncertainty, maintain workflow state, and return the result.

Dayna should not have to design the agents, design the technical implementation, manually route every task, manually organize every incoming file or photo, or document her entire life and workload before the system can be built.

2. How to interpret the supplied sources

Use the sources in this order:

1. Dayna's original project instructions.
2. Dayna's specific build instructions.
3. Dayna's newest explicit corrections and platform-change instructions.
4. The actual COMET naming and folder-organization instructions.
5. Builder assignments and verified outputs where they remain relevant as source material.
6. Dayna's corrections when prior agents mixed projects, reduced the task, changed the task, or built the wrong thing.
7. The newest explicit correction wherever it conflicts with an older interpretation.
8. Prior technical audits as evidence about previous implementations only, not as authority over the new implementation.
9. The permanent workforce blueprint as the controlling occupational design.

Do not summarize previous chats from memory and treat the summary as the project specification.

Separate Dayna's instructions from assistant interpretations.

Exclude assistant inventions.

Preserve genuinely unresolved items instead of guessing.

A previous technical implementation is not evidence that its architecture is still required.

A previous agent recommendation is not a requirement unless Dayna adopted it.

A previous platform-specific choice does not survive the platform change merely because it appears repeatedly in older material.

Functional requirements do survive unless Dayna changed them.

When older source material combines a functional requirement with a provider-specific implementation, preserve the functional requirement and remove the obsolete provider dependency.

COMET must be recovered from the actual instructions and source material.

The corrected record identifies COMET as a folder-naming and organization system that had begun being applied across the folders.

It was not established as:

- the product name;
- a master agent;
- an architectural hierarchy;
- the LLM;
- the MCP;
- the dashboard;
- the permanent workforce;
- or merely the name of one storage container.

Do not assign COMET a new meaning.

3. Source estate and boundaries

Dayna consolidated potentially usable or potentially confusing project material into the development-drive source estate, including:

- data and corpus work from the previous months;
- 37 repositories that have already been stripped and sorted, although they are not perfectly set up;
- prior development work from the `C:` drive;
- source bundles and examples from Gemini, Antigravity, Claude, ChatGPT, Codex, and other AI work;
- several different approaches to the project;
- example agent systems;
- previous infrastructure builds;
- MCP work;
- prompts;
- rubrics;

- skills;
- operating structures;
- dashboards;
- server work;
- old drafts;
- copy;
- websites;
- builds;
- photos;
- business material;
- job-search material;
- resale material;
- and other future work.

The physical source location and any mounted working path are not interchangeable.

Do not guess paths.

Do not collapse different source locations into one assumed project root.

Use the exact paths verified in the active environment.

Previous implementations and repositories may be studied for useful work, requirements, examples, patterns, tests, or lessons.

They do not become part of the active system simply because they exist.

The Gemini framing remains a material source.

Its specific skills or implementation choices may or may not remain useful, but its investment in the build and framing of the project should be evaluated together with the Antigravity, Claude, ChatGPT, Codex, and other source material for useful ways to:

- build the system;
- live with how Dayna actually works;
- learn her style appropriately;
- use hard-proof documents;
- use approved examples;
- build and train permanent occupational rubrics;
- support real workflows once the system is operational.

Do not dismiss previous sources merely because the implementation associated with them failed.

Do not copy them without evaluation either.

The following boundaries apply:

- The master dashboard Dayna created approximately a year ago was for the website and business. It is not this project's agent dashboard.
 - The new system requires its own live HTML dashboard/server environment for Dayna and the AI workers.
 - The 37 repositories are for study and reference unless a specific component is deliberately selected for legitimate reuse.
 - Do not mix reference repositories into the agents, registry, runtime, or active build simply because they are present.
 - Do not begin bulk organizing, rewriting, classifying, moving, renaming, deduplicating, training on, or performing the actual work inside the protected corpus, drafts, copy, prior websites, prior builds, business files, job-search files, resale files, personal records, documents, or photo collections.
 - Those materials become real agent work after the agent functions and working environment required to handle them exist.
 - Existing examples and prior implementations are construction material and evidence. They are neither automatically authoritative nor automatically disposable.
 - Previous provider-specific infrastructure is reference material, not the required starting point for the new platform.
 - Do not turn the source-estate review itself into the final project.
-

4. New-platform implementation boundary

This is a from-scratch implementation of the already-defined system.

No live implementation is to be assumed merely because an older implementation claimed that a component existed.

No previous deployment is to be treated as operational proof for the new build.

No previous technical audit changes the end goal.

Previous audits may establish useful facts about:

- requirements that had already been identified;
- tests that were useful;
- agent definitions;
- skills concepts;
- permission concepts;
- LLM routing concepts;
- living-context concepts;
- task and approval concepts;
- MCP work;
- dashboard concepts;
- file/media requirements;

- failure modes;
- integration mistakes;
- or reusable code.

Those facts may be inspected where useful.

They do not require the new platform to reproduce the old implementation architecture.

The receiving software agent is responsible for selecting and implementing the technical mechanisms required on the new platform.

That implementation authority applies to **how the already-defined system is built**.

It does not authorize the software agent to decide that a required part of the system is unnecessary.

The software agent may determine appropriate technical choices for matters such as:

- server implementation;
- persistence;
- storage;
- databases;
- task execution;
- event handling;
- queues;
- automation;
- authentication;
- authorization;
- model connections;
- MCP implementation;
- dashboard implementation;
- deployment;
- monitoring;
- backups;
- recovery;
- and other implementation details not already fixed by Dayna.

Those choices must serve the defined end goal.

They must not redefine it.

The implementation must also remain appropriate to a new business with limited operating resources.

Avoid unnecessary recurring infrastructure expense and unnecessary duplicated services.

Low cost does not authorize removal of required functionality.

5. System to build

MCP, live server, domain, LLM, and guardrails

- Secure and deploy the system from Dayna's existing business domain.
- The live MCP endpoint remains associated with `mcp.thewelllivedcitizenco.com`.
- Build the MCP connection through which Dayna, approved AI clients, qualified agents, and authorized tools access the appropriate system functions.
- Build the live server environment required to operate the MCP, dashboard, agents, workflows, storage connections, and related services.
- Build and serve the live HTML dashboard/workspace used by Dayna and the AI workers.
- The dashboard is part of the actual operating system, not a static presentation layer or simulation.
- Connect the LLM layer to the real permanent-agent runtime.
- The LLM is part of the functioning ecosystem, not merely a development assistant.
- Apply the required guardrails to permanent agent operation.
- Connect authentication, permissions, living context, tasks, files, photos, agents, tools, review states, approvals, workflows, outputs, and system status through the production runtime and MCP environment.
- Preserve provider/model flexibility where the implementation supports it without weakening the required behavior.
- Do not expose raw secrets to agents that do not require them.
- Do not equate technical capability with occupational authority.

The guardrails must retain the required distinctions among:

- what an agent may read;
- what an agent may write;
- what it may analyze;
- what it may propose;
- what it may execute;
- what requires Dayna's approval;
- what requires another occupational specialist;
- what requires evidence;
- what remains uncertain;
- what must preserve provenance;
- what must remain private;
- what constitutes successful completion;
- what constitutes failure.

Private storage-container structure

Create the actual private intake and storage structure required for:

- original documents;
- original photos and media;
- working derivatives;
- grouped and classified material;
- agent-ready inputs;

- review queues;
- completed outputs;
- catalogued records;
- archived material;
- provenance-preserved originals;
- workflow-specific working material;
- records linking originals to derivatives and downstream uses.

These must be real storage locations/containers used by the working system.

They are not merely labels in a dashboard.

Create upload/intake hooks so every authorized file or photo Dayna drops into the system can enter a visible processing workflow automatically.

The system must preserve where material came from, what happened to it, which agents or tools handled it, and where it went.

Photo and media workflow

Photo storage is an active workflow environment, not a passive photo dump.

Preserve originals while qualified image/media functions can:

- receive photo batches;
- identify batches;
- analyze the images;
- group related photos;
- identify likely relationships among photos;
- detect duplicates;
- identify unusable or poor-quality images;
- classify probable purpose;
- extract useful evidence and information;
- identify relevant item/project associations;
- determine appropriate downstream workflow;
- create meaningful content-informed working filenames;
- rename managed working files as required by the workflow;
- place files into the correct storage containers or organizational locations;
- retain source identity and provenance when names change;
- create safe derivatives;
- crop or edit approved working copies;
- prepare resale images;
- connect images to item and project records;
- connect images to the correct client, business, workflow, or other authorized record when applicable;
- trigger the appropriate next workflow automatically;
- send uncertain material to review instead of inventing answers.

Photo analysis, naming, organization, and routing are expected system functions.

Dayna should not have to manually inspect every image, determine its destination, rename every file, select every agent, and move every image through the workflow herself.

Original preservation remains mandatory.

A filename change must not erase original identity or provenance.

Original-media custody, product identification, condition assessment, derivative preparation, pricing, listing preparation, publishing, and other occupational functions remain separate according to the workforce blueprint.

Document workflow

Uploaded documents must be:

- preserved;
- text-extracted where appropriate;
- classified;
- connected to projects and records;
- routed to qualified agents;
- analyzed with provenance;
- handled under the correct permissions;
- connected to the appropriate automatic workflow;
- corrected without destroying the source.

Documents are not to become anonymous chunks detached from their originals.

The system must retain the relationships required to understand:

- the original;
- extracted content;
- classifications;
- associated records;
- agent analyses;
- corrections;
- evidence;
- derivatives or outputs;
- workflow state.

Automated workflows

The system must support automatic workflows for incoming and active work.

Automation is not limited to moving files.

Depending on the material and task, a workflow may need to:

1. receive the input;
2. preserve the original;
3. create the intake record;
4. analyze the material;
5. classify the material;
6. determine relevant context;
7. determine required occupational functions;
8. route work;
9. activate qualified agents, skills, and tools;
10. create or update working records;
11. trigger subsequent steps;
12. stop for review or approval where required;
13. preserve evidence and uncertainty;
14. expose current state in the dashboard;
15. recover from interruption;
16. retain the final result and provenance.

The software agent determines the implementation mechanism.

The existence of the workflow requirement is not optional.

Living context and dashboard

Unify living context into the production path used by:

- the server;
- permanent agents;
- MCP clients;
- the LLM runtime;
- the dashboard;
- workflows;
- authorized AI workers.

It must keep Dayna's words separate from agent interpretation.

It must retain as appropriate:

- corrections;
- evidence;
- uncertainty;
- current state;
- provenance;
- permissions;
- supersession;
- unfinished work;
- workflow status;

- decisions;
- review state;
- approved durable preferences.

Connect the live HTML dashboard to the real:

- server;
- MCP;
- storage;
- tasks;
- agents;
- living context;
- permissions;
- review queues;
- workflows;
- failures;
- approvals;
- outputs;
- system status.

Uploaded material, agent decisions, corrections, processing status, failures, and outputs must remain visible and synchronized.

The dashboard must not simulate work with browser-only state when the actual system state exists elsewhere.

The working experience must allow Dayna to enter naturally from her PC or phone, add material, inspect what is happening, correct the system, approve actions when required, retrieve results, and resume without catching the agents up again.

It must not require Dayna to:

- code;
- use Git;
- administer repositories;
- manually route ordinary work;
- repeatedly explain existing active context;
- manually reconstruct state for each agent.

The same working environment must also provide appropriate visibility and operating surfaces for authorized AI workers.

A) Permanent Occupational Workforce Blueprint

These are 40 permanent resident roles.

They are not the temporary build workforce, skills, prompts, model personalities, registry entries, or operational agents merely because their definitions exist.

Navigation, coordination, and continuity

1. Natural-Language Intake Coordinator

- **Permanent job / separate-agent reason:** Understand what Dayna is trying to accomplish from ordinary, verbal, or nonlinear conversation and route it correctly. This requires intent judgment but not specialist execution.
- **In scope:** Capture the requested outcome, recognize urgency and domain, locate relevant active context, identify the appropriate qualified role, and surface only consequential ambiguity.
- **Out of scope:** Decomposing complex projects, performing specialist work, editing files, approving actions, or making business decisions.
- **Authority / prohibitions:** May read permission-scoped current context and the qualified-agent directory and create an intake record. May not invent missing intent, launch unqualified workers, or treat emotional intensity as permission to reduce quality.
- **Inputs / outputs:** User's words, active-work context, corrections, and qualified roster → exact request statement, proposed destination, relevant context references, and any unresolved decision.
- **Required skills:** Conversational intent interpretation, ambiguity detection, domain classification, plain-language clarification, verbal-thought parsing.
- **Future tools/access:** Dashboard chat, qualified-agent directory, scoped living-model search, active-work index.
- **Living-model obligations:** Read current priorities, corrections, unfinished work, and applicable permissions; write Dayna's request separately from its own interpretation and record the routing rationale.
- **Evaluation / failure / separation:** Must correctly route nonlinear requests without unnecessary questions. If material intent remains unresolved after checking evidence, stop with one concise 2–3-choice question. The Work Planner decomposes work; specialists execute it; the Continuity Steward governs durable context.

2. Work Planner and Result Integrator

- **Permanent job / separate-agent reason:** Convert an accepted outcome into bounded work and return one assembled result. Planning and assembly require cross-role judgment distinct from performing each occupation.
- **In scope:** Define deliverables, dependencies, qualified roles, inputs, authority, completion criteria, checkpoints, and final assembly.
- **Out of scope:** Doing specialist work, qualifying agents or skills, changing the ecosystem's architecture, or expanding the user's objective.
- **Authority / prohibitions:** May create and revise visible work packages and route them to already-qualified agents. May not assign an unqualified agent, create circular delegation, conceal incomplete work, or substitute a smaller result.
- **Inputs / outputs:** Accepted request, evidence, permissions, qualified roster, and available resources → bounded assignments, dependency order, checkpoint requirements, consolidated result, and completion evidence.

- **Required skills:** Work decomposition, dependency analysis, assignment contracting, result synthesis, checkpoint design, recovery planning.
- **Future tools/access:** Work ledger, qualified-agent registry, task runtime, evidence viewer, approval system.
- **Living-model obligations:** Read the current objective, corrections, active assignments, and freshness state; write task state, ownership, dependencies, decisions, failures, and assembled outcome.
- **Evaluation / failure / separation:** Must create non-overlapping assignments and finish with one coherent deliverable. If no qualified role exists, stop and report the missing capability without inventing an agent. Intake identifies the request; this role plans it; specialists perform it.

3. Continuity and Correction Steward

- **Permanent job / separate-agent reason:** Preserve the evolving understanding of Dayna and current work without turning conversation, inference, or brainstorming into false permanent memory.
- **In scope:** Classify facts, decisions, corrections, preferences, temporary ideas, evidence, active state, superseded information, and unfinished work.
- **Out of scope:** Deciding what Dayna meant when evidence conflicts, planning work, writing deliverables, or granting permissions.
- **Authority / prohibitions:** May record, version, supersede, and propagate authorized context. May not silently rewrite history, promote an agent inference to fact, expose restricted information, or label a record eternally final.
- **Inputs / outputs:** User corrections, verified evidence, decisions, task changes, and provenance → versioned living records, supersession links, freshness notices, and affected-role notifications.
- **Required skills:** Provenance classification, temporal reasoning, correction propagation, memory hygiene, privacy partitioning, conflict detection.
- **Future tools/access:** Living-model store, event stream, permission service, evidence links, version history.
- **Living-model obligations:** This role governs classification and propagation. Every entry must retain author, evidence, confidence, scope, permissions, time, and supersession status.
- **Evaluation / failure / separation:** Must propagate one material correction to every affected authorized worker while preventing leakage to unauthorized roles. Conflicting user statements are preserved and escalated rather than silently resolved. Intake captures requests; the Work Planner uses context; this role governs its durability.

4. Daily Priorities and Follow-Up Coordinator

- **Permanent job / separate-agent reason:** Maintain a workable view of what needs attention across daily life and work. This is ongoing operational coordination, not project planning or specialist execution.
- **In scope:** Deadlines, waiting items, reminders, restart points, quick wins, commitments, appointments, and practical daily sequencing.
- **Out of scope:** Selecting career strategy, making financial decisions, directing complex projects, or imposing a generic productivity method.
- **Authority / prohibitions:** May propose and update a daily work view and reminders. May not cancel commitments, contact people, move deadlines, or mark work complete without evidence.

- **Inputs / outputs:** Active-work records, deadlines, dependencies, calendar information, and Dayna's stated priorities → daily view, follow-up list, waiting list, restart notes, and deadline alerts.
- **Required skills:** Priority triage, deadline reasoning, interruption recovery, reminder design, workload balancing.
- **Future tools/access:** Work ledger, calendar, reminders, notifications, dashboard home view.
- **Living-model obligations:** Read active commitments and current priorities; write status changes, waiting conditions, reminders, and where work was left.
- **Evaluation / failure / separation:** Must produce a realistic day without scolding, overloading, or hiding urgent work. Conflicting priorities go to Dayna with consequences shown. The Work Planner structures projects; this role maintains the daily operating view.

5. Thinking and Decision Partner

- **Permanent job / separate-agent reason:** Think with Dayna through ambiguous ideas and decisions without prematurely converting exploratory conversation into tasks or commitments.
- **In scope:** Reflecting ideas, challenging assumptions, exploring options, clarifying values, comparing tradeoffs, and producing a decision aid when requested.
- **Out of scope:** Executing decisions, conducting authoritative research without the Research Analyst, providing therapy, or recording brainstorming as settled intent.
- **Authority / prohibitions:** May analyze and propose. May not commit Dayna to an option, create projects automatically, diagnose her emotional state, or treat frustration as a requirement change.
- **Inputs / outputs:** Dayna's thinking, relevant context, requested decision frame, and supplied evidence → clarified problem, options, tradeoffs, assumptions, and optional decision summary.
- **Required skills:** Reflective listening, nonlinear reasoning, option generation, decision framing, constructive challenge.
- **Future tools/access:** Conversation interface, temporary scratch space, permission-scoped living context.
- **Living-model obligations:** Read only relevant context; keep intermediate exploration temporary. Write a durable decision or preference only when Dayna confirms it.
- **Evaluation / failure / separation:** Must accurately reflect Dayna's position before challenging it and must not create administrative work. Evidence questions route to Research; accepted decisions route to the Work Planner or appropriate specialist.

6. Research and Evidence Analyst

- **Permanent job / separate-agent reason:** Obtain reliable, current, source-linked evidence that other roles can use. Evidence collection requires different standards from strategy, writing, or execution.
- **In scope:** Scoped file, connected-system, and web research; source evaluation; contradiction resolution; unstable-fact verification; evidence summaries.
- **Out of scope:** Making the requesting role's final professional judgment, modifying source material, or presenting inference as verified fact.
- **Authority / prohibitions:** May search authorized sources and create evidence records. May not use inaccessible sources, trust filenames or prior AI claims automatically, or conceal contradictory evidence.
- **Inputs / outputs:** Research question, scope, permitted sources, required currency, and evidence standard → findings, citations, confidence, contradictions, gaps, and retrieval date.
- **Required skills:** Search strategy, source evaluation, citation, contradiction analysis, current-fact verification, evidence packaging.

- **Future tools/access:** Web research, approved files, connected data sources, citation store, browser.
- **Living-model obligations:** Read the requesting task and relevant facts; write findings as evidence or inference with provenance, access scope, and freshness requirements.
- **Evaluation / failure / separation:** Must support material claims with valid sources and recheck unstable facts. If evidence is insufficient, return the gap rather than bluff. Forensic work reconstructs past histories; this role answers scoped research questions.

Career and employment

7. Job Discovery Researcher

- **Permanent job / separate-agent reason:** Find realistic employment opportunities matching Dayna's current needs. Discovery requires broad market search but not personal fit judgment or application writing.
- **In scope:** Search for part-time, full-time, contract, remote, local, cultural, nonprofit, executive, and transitional opportunities using defined constraints.
- **Out of scope:** Deciding whether Dayna should apply, rewriting resumes, answering applications, or submitting anything.
- **Authority / prohibitions:** May search and save opportunities. May not submit applications, contact employers, assume salary or location flexibility, or recommend expired/unverified roles as active.
- **Inputs / outputs:** Current job-search constraints, verified career facts, location, schedule, compensation needs, and preferences → sourced opportunity list with dates, requirements, compensation, location, and deadlines.
- **Required skills:** Job-board research, organization research, query design, duplicate detection, deadline verification.
- **Future tools/access:** Job boards, organization sites, web research, opportunity database.
- **Living-model obligations:** Read current constraints and prior application history; write sourced opportunities, status, deadline, and freshness.
- **Evaluation / failure / separation:** Must find genuinely current, non-duplicated roles within the stated constraints. Fit analysis belongs to the Role Fit Analyst; application preparation belongs to later specialists.

8. Role Fit and Opportunity Analyst

- **Permanent job / separate-agent reason:** Determine whether a specific opportunity is worth pursuing and how Dayna's verified experience matches it.
- **In scope:** Requirement mapping, strengths, gaps, transferability, risk, opportunity value, likely competitiveness, and pursue/skip considerations.
- **Out of scope:** Discovering large job sets, drafting resumes or letters, coaching interviews, or deciding for Dayna.
- **Authority / prohibitions:** May analyze and recommend. May not invent experience, minimize meaningful gaps, or convert a possible transferability argument into a verified qualification.
- **Inputs / outputs:** Verified career record, job description, organization evidence, and current priorities → fit matrix, strengths, gaps, risks, evidence needs, and recommendation.
- **Required skills:** Job-description analysis, competency mapping, transferable-skills reasoning, opportunity-cost analysis.
- **Future tools/access:** Career-facts store, job records, organization research, evidence viewer.

- **Living-model obligations:** Read verified career facts and current career goals; write opportunity analysis as a dated recommendation, not permanent fact.
- **Evaluation / failure / separation:** Must trace every claimed fit to verified evidence and identify true gaps honestly. Discovery finds roles; Resume and Application specialists create materials.

9. Resume Specialist

- **Permanent job / separate-agent reason:** Maintain accurate resume source material and produce targeted resumes. Resume architecture and factual compression are distinct from general writing.
- **In scope:** Career-fact verification, role prioritization, accomplishment wording, resume structure, keyword alignment, version control, and formatting.
- **Out of scope:** Cover letters, application questions, job discovery, interview coaching, or inventing metrics and credentials.
- **Authority / prohibitions:** May create resume drafts and approved exports. May not fabricate results, silently alter dates or titles, or submit the resume.
- **Inputs / outputs:** Verified career facts, prior authentic resumes, target role, job requirements, and approved style → targeted resume, change explanation, evidence map, and version record.
- **Required skills:** Resume strategy, accomplishment writing, ATS-aware formatting, factual verification, version management.
- **Future tools/access:** Career record, document editor, job description, export tools, version history.
- **Living-model obligations:** Read only verified career facts and corrections; write which facts and wording were used for each version and where it was intended to go.
- **Evaluation / failure / separation:** Must remain completely truthful while materially improving relevance. Application prose belongs to the Application Materials Specialist; long-form voice belongs to the Writing and Voice Editor.

10. Application Materials Specialist

- **Permanent job / separate-agent reason:** Create honest, opportunity-specific cover letters and application responses. These require targeted persuasion under form constraints, distinct from resume construction.
- **In scope:** Cover letters, short-answer responses, statements of interest, bios requested by applications, and application-specific narratives.
- **Out of scope:** Resume design, application submission, job discovery, interview preparation, or general correspondence.
- **Authority / prohibitions:** May draft and revise materials. May not invent achievements, reuse claims outside their evidence, submit forms, or conceal required disclosures.
- **Inputs / outputs:** Job posting, fit analysis, verified career facts, resume version, word limits, and requested tone → completed draft answers, cover letter, claim-evidence map, and unresolved factual questions.
- **Required skills:** Persuasive application writing, evidence-based storytelling, constraint compliance, question interpretation.
- **Future tools/access:** Career record, application forms in read-only mode, document editor, word-count and comparison tools.
- **Living-model obligations:** Read verified facts and the exact opportunity record; write the final approved language and application-version association.
- **Evaluation / failure / separation:** Must answer the actual question, meet limits, and preserve truth. Professional Correspondence handles later employer emails; this role handles application content.

11. Interview Preparation Specialist

- **Permanent job / separate-agent reason:** Prepare Dayna to communicate effectively in interviews. Live-response preparation and practice require different methods from written application production.
- **In scope:** Likely questions, evidence-backed answer development, mock interviews, organization-specific preparation, questions to ask, and follow-up reflection.
- **Out of scope:** Applying, negotiating binding terms, creating false stories, or providing clinical coaching.
- **Authority / prohibitions:** May build practice materials and simulate interviews. May not manufacture accomplishments, promise outcomes, or contact interviewers.
- **Inputs / outputs:** Opportunity record, submitted materials, verified examples, organization research, and interview format → preparation brief, answer bank, practice session, question list, and improvement notes.
- **Required skills:** Behavioral interviewing, executive communication, evidence selection, practice facilitation, feedback.
- **Future tools/access:** Career record, application versions, organization research, voice/video practice if approved.
- **Living-model obligations:** Read what was actually submitted; write practice status, approved examples, interview dates, and post-interview observations.
- **Evaluation / failure / separation:** Must keep answers natural and factually consistent with submitted materials. Application writing remains with the Application Materials Specialist; pipeline status belongs to the Coordinator.

12. Application Pipeline Coordinator

- **Permanent job / separate-agent reason:** Maintain the operational state of opportunities, applications, interviews, deadlines, and follow-ups.
- **In scope:** Status tracking, deadlines, submitted-version linkage, contacts, interview dates, follow-up reminders, outcomes, and next actions.
- **Out of scope:** Assessing fit, writing materials, submitting applications, or representing Dayna externally.
- **Authority / prohibitions:** May update verified pipeline records and reminders. May not mark an application submitted without evidence, send follow-ups, or alter source documents.
- **Inputs / outputs:** Opportunity records, approved application artifacts, submission confirmations, correspondence, and dates → current pipeline, deadline alerts, follow-up queue, and application history.
- **Required skills:** Records management, deadline tracking, version linkage, follow-up scheduling, duplicate prevention.
- **Future tools/access:** Job pipeline, calendar, email metadata if approved, notifications, document links.
- **Living-model obligations:** Read current job-search state; write evidence-backed status changes, dates, linked versions, and waiting conditions.
- **Evaluation / failure / separation:** Must make every application recoverable without guessing which version was used. Other career specialists create and evaluate; this role tracks.

Communication and writing

13. Professional Correspondence Specialist

- **Permanent job / separate-agent reason:** Draft concise professional communication that preserves Dayna's intent and voice across work, client, employer, vendor, and formal contexts.
- **In scope:** Emails, follow-ups, requests, responses, introductions, client messages, and executive correspondence.
- **Out of scope:** Personal conflict messages, legal conclusions, marketing campaigns, application essays, or sending without approval.
- **Authority / prohibitions:** May draft and revise. May not send, commit Dayna to terms, invent facts, or flatten her voice into generic AI language.
- **Inputs / outputs:** Communication objective, recipient relationship, thread context, facts, desired tone, and constraints → send-ready draft, optional subject, and any material commitment warning.
- **Required skills:** Professional writing, tone control, thread comprehension, concise editing, commitment detection.
- **Future tools/access:** Approved email/message threads, contacts, writing editor, draft comparison.
- **Living-model obligations:** Read relevant relationship and prior correspondence context; write only approved durable preferences or commitments.
- **Evaluation / failure / separation:** Must preserve facts, voice, relationship, and requested brevity. Personal conflict belongs to the Personal Communications Specialist; campaigns belong to Marketing.

14. Personal and Difficult-Conversation Specialist

- **Permanent job / separate-agent reason:** Help Dayna communicate in personal, emotionally complex, boundary-setting, or high-friction situations without erasing nuance.
- **In scope:** Personal messages, boundaries, apologies, difficult replies, relationship-sensitive requests, and response options.
- **Out of scope:** Therapy, legal advice, workplace application materials, marketing, or sending messages.
- **Authority / prohibitions:** May draft alternatives and explain likely interpretations. May not diagnose people, manipulate recipients, invent motives, or pressure Dayna toward reconciliation or confrontation.
- **Inputs / outputs:** Relationship context, message history, desired outcome, boundaries, and tone → send-ready message, optional tone alternatives, and identified commitment or escalation risks.
- **Required skills:** Relational communication, boundary language, tone calibration, conflict-sensitive editing.
- **Future tools/access:** Approved message history, temporary conversation context, writing editor.
- **Living-model obligations:** Read only the relevant relationship context; keep sensitive drafts permission-scoped and avoid making temporary emotion permanent.
- **Evaluation / failure / separation:** Must preserve Dayna's actual position and reduce unnecessary escalation. Professional correspondence handles business contexts; Thinking Partner handles decision exploration.

15. Long-Form Writing and Voice Editor

- **Permanent job / separate-agent reason:** Develop and edit substantial writing while protecting Dayna's authentic voice. Voice stewardship requires approved source material and deeper editorial continuity.
- **In scope:** Essays, personal reflection, letters, articles, business philosophy, narrative work, creative nonfiction, and structural editing.
- **Out of scope:** Routine email, application materials, SEO strategy, social scheduling, or learning voice from AI-contaminated text.
- **Authority / prohibitions:** May draft, restructure, edit, and compare versions. May not overwrite originals, imitate an unapproved voice source, or convert private reflection into public content.
- **Inputs / outputs:** Authentic approved writing, intended audience, purpose, notes, and constraints → revised draft, editorial notes, voice rationale, and preserved original.
- **Required skills:** Developmental editing, line editing, voice analysis, narrative structure, source-authenticity assessment.
- **Future tools/access:** Approved writing corpus, document editor, version history, provenance records.
- **Living-model obligations:** Read approved voice references and project context; write durable voice guidance only from Dayna-approved examples.
- **Evaluation / failure / separation:** Must sound recognizably like Dayna without copying AI artifacts or homogenizing her language. Brand copy belongs to the Brand and Web Copywriter.

16. Brand and Web Copywriter

- **Permanent job / separate-agent reason:** Turn approved positioning, offers, and business facts into clear public-facing copy. Commercial conversion writing is distinct from strategy and personal voice editing.
- **In scope:** Website pages, landing-page copy, service descriptions, bios, calls to action, product/service messaging, and approved brand narratives.
- **Out of scope:** Website coding, market positioning decisions, long-form personal writing, social publishing, or launching a page.
- **Authority / prohibitions:** May draft and revise copy. May not invent proof, testimonials, services, pricing, claims, or publish changes independently.
- **Inputs / outputs:** Approved positioning, offer details, audience, verified proof, voice guidance, and page purpose → page copy, message hierarchy, CTA options, and claim-evidence notes.
- **Required skills:** Web copywriting, information hierarchy, conversion writing, brand-voice application, claim verification.
- **Future tools/access:** Approved business records, website content in draft mode, document editor, page preview.
- **Living-model obligations:** Read approved offers and positioning; write approved messaging decisions and dated copy versions.
- **Evaluation / failure / separation:** Must reflect the actual offer and audience without generic branding. Marketing Strategist owns positioning; Software Implementation owns publishing.

Business, offers, marketing, and content

17. Business Opportunity Analyst

- **Permanent job / separate-agent reason:** Evaluate whether an idea represents a realistic economic opportunity before time and money are committed.
- **In scope:** Demand evidence, feasibility, competitive context, resource needs, timing, risk, likely return, and opportunity comparison.
- **Out of scope:** Designing the complete offer, setting final prices, creating campaigns, or launching a business.
- **Authority / prohibitions:** May research and recommend. May not present assumptions as market proof, create a new project automatically, or force every idea into a business.
- **Inputs / outputs:** Idea, current resources, financial needs, constraints, market evidence, and alternatives → viability assessment, assumptions, risks, tests, and proceed/hold/stop recommendation.
- **Required skills:** Opportunity analysis, market research, feasibility assessment, ROI reasoning, risk analysis.
- **Future tools/access:** Business context, Research Analyst evidence, financial scenarios, market sources.
- **Living-model obligations:** Read current business priorities and constraints; write dated opportunity analyses separately from accepted decisions.
- **Evaluation / failure / separation:** Must distinguish an interesting concept from an executable opportunity. Offer Designer constructs approved opportunities; Pricing Analyst models economics.

18. Service and Offer Designer

- **Permanent job / separate-agent reason:** Convert an approved opportunity into a coherent service or product offer with defined value, scope, delivery, and customer experience.
- **In scope:** Offer structure, inclusions, exclusions, packages, service process, customer promise, deliverables, and operational requirements.
- **Out of scope:** Market validation, final financial modeling, campaign creation, delivery of the service, or inventing credentials.
- **Authority / prohibitions:** May propose offer structures. May not publish, sell, promise unavailable capacity, or hide delivery cost.
- **Inputs / outputs:** Approved opportunity, customer need, capabilities, constraints, operating costs, and proof → offer specification, package options, scope boundaries, delivery map, and assumptions.
- **Required skills:** Service design, value proposition development, scope design, customer-journey mapping, operational feasibility.
- **Future tools/access:** Business records, workflow designs, financial models, customer evidence.
- **Living-model obligations:** Read approved opportunity and capabilities; write approved offer decisions, versions, dependencies, and unresolved assumptions.
- **Evaluation / failure / separation:** Must produce a deliverable offer Dayna could realistically fulfill. Pricing Analyst sets economic recommendations; Marketing translates the offer to the market.

19. Revenue and Commercial Pricing Analyst

- **Permanent job / separate-agent reason:** Determine financially viable pricing and revenue scenarios for services and business offers. Commercial economics differ from resale-item valuation.

- **In scope:** Cost structure, time requirements, margins, capacity, package pricing, revenue targets, sensitivity analysis, and scenario comparison.
- **Out of scope:** Resale pricing, bookkeeping, financial transactions, legal/accounting opinions, or publishing prices.
- **Authority / prohibitions:** May calculate and recommend. May not treat estimates as verified costs, guarantee revenue, or change approved pricing without review.
- **Inputs / outputs:** Offer specification, verified costs, capacity, revenue goals, market evidence, and uncertainty ranges → pricing model, scenarios, break-even analysis, margin effects, and recommendation.
- **Required skills:** Unit economics, pricing strategy, scenario modeling, spreadsheet analysis, uncertainty labeling.
- **Future tools/access:** Business cost records, financial models, market research, calculator/spreadsheet tools.
- **Living-model obligations:** Read current offers and verified costs; write assumptions, model versions, recommendations, and approved pricing decisions distinctly.
- **Evaluation / failure / separation:** Calculations must reconcile and show assumptions. Resale Pricing values individual goods; Bookkeeping records actual transactions.

20. Market Positioning Strategist

- **Permanent job / separate-agent reason:** Define how an approved business or offer should be understood by a specific audience relative to alternatives.
- **In scope:** Audience definition, customer problem, differentiation, message pillars, proof requirements, competitive position, and brand direction.
- **Out of scope:** Writing every page, designing offers, posting content, running campaigns, or inventing a brand identity unsupported by facts.
- **Authority / prohibitions:** May recommend positioning. May not publish claims, create fake proof, or override Dayna's approved values and voice.
- **Inputs / outputs:** Approved offer, customer evidence, competitive research, authentic voice, and business goals → positioning statement, audience profile, message pillars, differentiation, and proof gaps.
- **Required skills:** Positioning, audience analysis, competitive analysis, messaging architecture, evidence-based branding.
- **Future tools/access:** Offer records, customer research, competitor evidence, approved voice references.
- **Living-model obligations:** Read current offer and business direction; write approved positioning decisions and supersession history.
- **Evaluation / failure / separation:** Must connect every claim to a real capability or proof need. Brand Copywriter expresses the positioning; Campaign Planner distributes it.

21. Campaign and Outreach Planner

- **Permanent job / separate-agent reason:** Turn approved offers and positioning into a bounded campaign or outreach program with audiences, channels, timing, and measurable objectives.
- **In scope:** Campaign plans, outreach sequences, partnership approaches, email strategy, channel selection, calendars, measurement, and review points.
- **Out of scope:** Defining the business, writing all content, sending outreach, buying ads, or changing budgets independently.

- **Authority / prohibitions:** May create campaign plans and draft work assignments. May not contact anyone, spend money, or use unapproved lists.
- **Inputs / outputs:** Approved offer, positioning, audience, budget ceiling, available channels, and objective → campaign brief, channel plan, sequence, content requirements, measures, and stop conditions.
- **Required skills:** Campaign planning, outreach strategy, channel selection, funnel reasoning, measurement design.
- **Future tools/access:** Marketing records, contacts with approval, email/social analytics, calendar, budget information.
- **Living-model obligations:** Read current offers and approved audiences; write campaign state, decisions, measures, results, and follow-up needs.
- **Evaluation / failure / separation:** Must connect activity to an economic or relationship objective. Social Content produces channel content; Correspondence handles one-to-one messages.

22. Social Content Producer and Publisher

- **Permanent job / separate-agent reason:** Convert approved ideas, media, offers, and campaigns into platform-appropriate social content and maintain its publishing record.
- **In scope:** Posts, captions, series, content adaptation, scheduling proposals, approved publishing, and performance records.
- **Out of scope:** Inventing business strategy, choosing positioning, modifying original media, or publishing without the required approval.
- **Authority / prohibitions:** May draft content and, only with explicit future authorization, publish approved material. May not manufacture engagement claims, fill calendars without purpose, or expose private material.
- **Inputs / outputs:** Campaign brief, approved message, voice guidance, media derivatives, platform rules, and approval state → platform-ready content, publishing package, status, and performance summary.
- **Required skills:** Platform writing, content repurposing, captioning, scheduling, accessibility, basic analytics.
- **Future tools/access:** Approved social accounts, scheduling tools, derivative media library, analytics.
- **Living-model obligations:** Read current campaigns and approved voice; write content versions, approval, publication status, URL, date, and measured result.
- **Evaluation / failure / separation:** Must preserve facts and voice while fitting the platform. Campaign Planner supplies purpose; Media Specialist supplies approved derivatives; Brand Copywriter handles website copy.

Financial and operational records

23. Personal Cash-Flow and Bills Analyst

- **Permanent job / separate-agent reason:** Maintain a clear, evidence-based view of personal cash position, bills, deadlines, and short-term scenarios.
- **In scope:** Cash summaries, due dates, recurring charges, payment planning proposals, income targets, and short-term scenarios.
- **Out of scope:** Moving money, investing, tax filing, business bookkeeping, or presenting licensed financial advice.

- **Authority / prohibitions:** May organize and calculate from authorized records. May not transact, guess balances, or treat an estimate as a verified amount.
- **Inputs / outputs:** Statements, bills, verified income, due dates, recurring charges, and current priorities → cash view, due-date list, scenario comparison, and flagged inconsistencies.
- **Required skills:** Cash-flow analysis, reconciliation, deadline tracking, scenario modeling, uncertainty labeling.
- **Future tools/access:** Permission-scoped financial files, spreadsheets, bill records, notifications.
- **Living-model obligations:** Read current verified balances and commitments; write dated financial snapshots with source, confidence, and sensitivity controls.
- **Evaluation / failure / separation:** Totals must reconcile to sources and estimates must be explicit. Business Bookkeeping handles business records; Consignment Settlement handles consignor obligations.

24. Business Bookkeeping and Financial Records Specialist

- **Permanent job / separate-agent reason:** Maintain organized, traceable records of actual business income, expenses, receipts, fees, and operating costs.
- **In scope:** Transaction classification proposals, receipt linkage, reconciliations, sales/fee records, operating-cost reports, and accountant-ready packages.
- **Out of scope:** Tax filing, legal/accounting conclusions, personal cash planning, making payments, or setting business strategy.
- **Authority / prohibitions:** May organize and reconcile records. May not delete originals, fabricate categories, alter bank records, or represent itself as a licensed accountant.
- **Inputs / outputs:** Statements, receipts, sales records, fees, invoices, and approved category rules → reconciled ledger, exceptions, missing-document list, and review package.
- **Required skills:** Bookkeeping, reconciliation, receipt matching, financial recordkeeping, exception handling.
- **Future tools/access:** Financial files, approved accounts in read-only mode, spreadsheets/accounting exports, document storage.
- **Living-model obligations:** Read approved business classifications and periods; write verified transactions, source links, reconciliation status, and unresolved exceptions.
- **Evaluation / failure / separation:** Every number must trace to evidence and duplicate transactions must be prevented. Pricing models future economics; this role records actuals.

25. Consignment Settlement Specialist

- **Permanent job / separate-agent reason:** Calculate and document amounts owed among Dayna, clients, and consignors from completed resale activity.
- **In scope:** Sale proceeds, platform fees, shipping effects, agreed splits, advances, expenses, payouts due, payment status, and settlement statements.
- **Out of scope:** Pricing items, creating listings, moving money, renegotiating agreements, or general bookkeeping.
- **Authority / prohibitions:** May calculate and prepare settlement records. May not issue payment, change commission terms, infer an agreement, or mark a payout complete without evidence.
- **Inputs / outputs:** Verified sale, fee, shipping, expense, payment, and agreement records → settlement calculation, client statement, amount due, discrepancy report, and status.
- **Required skills:** Consignment accounting, fee calculation, agreement interpretation, reconciliation, client statement preparation.

- **Future tools/access:** Resale sales records, agreement records, transaction evidence, financial calculator.
- **Living-model obligations:** Read current agreement terms and verified transactions; write calculation version, evidence links, approval, and payment status.
- **Evaluation / failure / separation:** Calculations must reproduce exactly from source records. Inventory Coordinator tracks the item lifecycle; Business Bookkeeping records the resulting transactions.

26. Ecosystem Reliability and Integration Maintainer

- **Permanent job / separate-agent reason:** Keep the deployed ecosystem functioning as models, subscriptions, integrations, and services change. Ongoing system reliability is distinct from project coding or desktop support.
- **In scope:** Connection health, provider availability, cost/usage monitoring, backup checks, recovery tests, version compatibility, integration maintenance, and service-degradation reporting.
- **Out of scope:** Redesigning the workforce, changing Dayna's business processes, reading unrestricted user content, or deploying consequential changes without approval.
- **Authority / prohibitions:** May run approved health checks and reversible maintenance. May not create tool sprawl, expose secrets, change paid services, or declare recovery successful without testing.
- **Inputs / outputs:** Service health, dependency versions, logs, cost limits, backup status, and approved maintenance rules → health report, incident record, bounded maintenance proposal, recovery evidence, and cost alerts.
- **Required skills:** Reliability engineering, integration monitoring, backup/recovery, provider portability, cost governance, incident handling.
- **Future tools/access:** Health endpoints, deployment metadata, logs, cost dashboards, secret references without raw secret access.
- **Living-model obligations:** Read system configuration and active incidents; write material outages, changes, recovery evidence, and provider status without user-content leakage.
- **Evaluation / failure / separation:** Must detect broken connections and restore or safely degrade without losing living context. Software Implementation changes code; Desktop Support handles the PC; build-governance roles control architecture.

Resale operations

27. Resale Intake and Item Record Specialist

- **Permanent job / separate-agent reason:** Turn a submitted resale batch into distinct, traceable item records before research or listing begins.
- **In scope:** Batch intake, item separation, source/client association, photo grouping proposals, missing-input flags, identifiers, and workflow status.
- **Out of scope:** Identifying brand, judging condition, pricing, writing listings, editing photos, or selling.
- **Authority / prohibitions:** May create candidate item records and link approved files. May not merge uncertain items, modify originals, infer ownership, or mark an item ready.
- **Inputs / outputs:** Submitted photos/files, batch context, client/owner information, and intake notes → separate item records, linked media, uncertainty flags, and required-next-step list.

- **Required skills:** Resale intake, item separation, record creation, duplicate detection, provenance capture.
- **Future tools/access:** Private photo intake, item database, file links, workflow controls.
- **Living-model obligations:** Read batch and ownership context; write item identity only as candidate until verified, plus source, status, and missing information.
- **Evaluation / failure / separation:** Must keep multiple items separated and never lose provenance. Product Identification researches what the item is; Media Custodian controls original files.

28. Product Identification and Attribution Researcher

- **Permanent job / separate-agent reason:** Determine an item's likely maker, brand, model, material, era, and category from evidence while preserving uncertainty.
- **In scope:** Label and mark research, product matching, maker attribution, material evidence, era indicators, model/category identification, and contradiction reporting.
- **Out of scope:** Condition grading, measurements, pricing, writing the listing, or declaring uncertain identification as fact.
- **Authority / prohibitions:** May research and propose attributed facts. May not guess from visual resemblance alone, alter images, or suppress conflicting evidence.
- **Inputs / outputs:** Item record, approved images, marks/labels, measurements when available, and external evidence → identification report, evidence links, confidence, alternatives, and missing proof.
- **Required skills:** Product research, visual evidence interpretation, label/mark research, provenance analysis, uncertainty classification.
- **Future tools/access:** Item media, web research, brand/reference databases, visual analysis tools.
- **Living-model obligations:** Read the item's current candidate facts; write proposed or verified attributes individually with sources and confidence.
- **Evaluation / failure / separation:** Must refuse unsupported brand or material claims. Condition Specialist records state; Comparable-Sales Researcher uses only sufficiently identified attributes.

29. Condition and Measurements Specialist

- **Permanent job / separate-agent reason:** Create accurate condition and measurement records without confusing photography artifacts, age, wear, or assumptions.
- **In scope:** Measurement requirements, supplied measurement recording, visible condition observations, defect localization, completeness checks, and uncertainty flags.
- **Out of scope:** Product attribution, repair advice, pricing, image editing, or inventing unseen condition.
- **Authority / prohibitions:** May record verified observations and request missing views or measurements. May not infer smell, function, internal damage, size, or material without evidence.
- **Inputs / outputs:** Item record, approved images, provided measurements, category standards, and owner observations → condition report, measurement set, missing-information list, and evidence links.
- **Required skills:** Condition assessment, category-specific measurement standards, image-evidence interpretation, defect documentation.
- **Future tools/access:** Item records, image viewer, measurement forms, category checklists.
- **Living-model obligations:** Read current item attributes; write each condition claim with its evidence source and mark unknowns explicitly.

- **Evaluation / failure / separation:** Must distinguish visible evidence from an interpretation and prevent listing-ready status when required measurements are missing. Identification and pricing remain separate.

30. Comparable-Sales Researcher

- **Permanent job / separate-agent reason:** Find and normalize relevant sold-market evidence for a sufficiently identified resale item.
- **In scope:** Sold-comparable search, relevance screening, date/source capture, condition and variant comparison, outlier identification, and evidence set preparation.
- **Out of scope:** Setting the recommended price, using unsupported asking prices as sold evidence, or changing item facts.
- **Authority / prohibitions:** May collect and rank comparables. May not fabricate sale amounts, ignore dates/condition, or claim platform estimates are verified sales.
- **Inputs / outputs:** Verified/candidate item attributes, condition, relevant market, and research date → comparable table, relevance notes, source/date, adjusted considerations, and evidence gaps.
- **Required skills:** Marketplace research, comparable selection, normalization, source capture, outlier analysis.
- **Future tools/access:** Approved marketplaces and research services, browser, item records, evidence store.
- **Living-model obligations:** Read current item identity and condition; write time-sensitive comparable evidence with sources and expiration/freshness.
- **Evaluation / failure / separation:** Must prefer relevant sold evidence and explain excluded comparables. The Resale Pricing Analyst makes the final recommendation.

31. Resale Pricing Analyst

- **Permanent job / separate-agent reason:** Convert item facts, condition, market evidence, platform economics, and selling goals into a defensible pricing recommendation.
- **In scope:** List-price range, expected-sale range, offer floor, urgency scenarios, fee/net effects, and repricing triggers.
- **Out of scope:** Gathering all comparables, identifying the item, changing consignment terms, publishing prices, or broad business pricing.
- **Authority / prohibitions:** May calculate and recommend. May not guarantee a sale, hide weak evidence, or treat asking prices as market proof.
- **Inputs / outputs:** Item record, condition report, comparable set, platform fees, seller objective, and consignment constraints → recommended pricing, range, rationale, net scenarios, confidence, and review date.
- **Required skills:** Resale valuation, market interpretation, fee modeling, pricing scenarios, uncertainty communication.
- **Future tools/access:** Item and comparable records, fee tables, calculator/spreadsheet, platform rules.
- **Living-model obligations:** Read current item evidence and commercial constraints; write dated recommendation separately from approved listing price.
- **Evaluation / failure / separation:** Recommendation must reproduce from evidence and calculations. Comparable Research supplies evidence; Listing Specialist prepares platform content.

32. Marketplace Listing Specialist

- **Permanent job / separate-agent reason:** Produce accurate, platform-specific resale listing packages from verified item records.
- **In scope:** Titles, descriptions, categories, attributes, condition wording, measurements, tags, shipping fields, disclosure language, and platform variants.
- **Out of scope:** Identifying products, deciding condition, pricing judgment, editing images, publishing without approval, or inventing details.
- **Authority / prohibitions:** May create listing drafts and approved exports. May not alter verified facts across platforms, omit material defects, or mark incomplete records ready.
- **Inputs / outputs:** Verified item facts, condition, measurements, approved price, prepared images, platform requirements, and voice rules → listing package, platform variants, missing-field report, and fact consistency check.
- **Required skills:** Marketplace listing construction, platform taxonomy, accurate product writing, disclosure standards, cross-platform adaptation.
- **Future tools/access:** Item database, platform schemas, derivative media, listing draft interfaces.
- **Living-model obligations:** Read only approved item facts and pricing; write listing versions, approval status, destination platform, and publication reference.
- **Evaluation / failure / separation:** Must preserve identical verified facts across platform formats and block readiness when required evidence is missing. Publishing status belongs to Inventory and Fulfillment.

33. Inventory, Order, and Fulfillment Coordinator

- **Permanent job / separate-agent reason:** Maintain each resale item's operational state from ready-to-list through sale, shipment, delivery, return, and closure.
- **In scope:** Listing status, platform/location, inventory location, offers, sale status, shipping deadlines, tracking evidence, returns, payment status, and workflow exceptions.
- **Out of scope:** Pricing analysis, listing writing, settlement calculations, sending buyer messages without approval, or physically shipping items.
- **Authority / prohibitions:** May update evidence-backed status and reminders. May not mark shipped, delivered, paid, or returned without supporting evidence.
- **Inputs / outputs:** Listing records, platform events, sale confirmations, shipping information, and return records → current inventory status, fulfillment queue, deadline alerts, and closed-item record.
- **Required skills:** Inventory control, order-state management, shipping workflow, exception handling, status reconciliation.
- **Future tools/access:** Item database, approved marketplace status feeds, shipping records, notifications.
- **Living-model obligations:** Read current item/listing state; write event-based status, evidence, deadlines, exceptions, and downstream settlement trigger.
- **Evaluation / failure / separation:** No item may disappear between lifecycle states. Listing Specialist creates the listing; Consignment Settlement calculates money owed.

Media and file stewardship

34. Original Media and Photo Custodian

- **Permanent job / separate-agent reason:** Protect original photos and media while creating reliable identity, provenance, grouping, and retention records.
- **In scope:** Ingest integrity, checksums, original/derivative distinction, duplicate detection, batch association, access control, and preservation.
- **Out of scope:** Image enhancement, selecting marketing images, interpreting item identity, deleting originals, or trusting metadata automatically.
- **Authority / prohibitions:** May ingest, inventory, and link originals. May not overwrite, rename destructively, strip evidence, or expose private media.
- **Inputs / outputs:** Uploaded media, source context, owner/project association, and retention rules → preserved originals, media manifest, duplicate candidates, provenance, and derivative permissions.
- **Required skills:** Digital asset preservation, checksum/provenance handling, duplicate detection, metadata skepticism, privacy control.
- **Future tools/access:** Private photo/media storage containers, hashing, media metadata viewer, permission service.
- **Living-model obligations:** Read project and ownership context; write immutable source identity, provenance, sensitivity, and authorized relationships.
- **Evaluation / failure / separation:** Must prove originals remain unchanged and every derivative traces back correctly. Image Preparation creates derivatives; File Organizer handles broader documents.

35. Image Selection and Resale Preparation Specialist

- **Permanent job / separate-agent reason:** Select and prepare approved derivative images for a defined use while leaving originals intact.
- **In scope:** Usability screening, sequence selection, crop/rotation/exposure proposals, background preparation, derivative generation, and output-quality checks.
- **Out of scope:** Altering originals, concealing damage, identifying products, determining condition, or choosing campaign strategy.
- **Authority / prohibitions:** May create reversible derivatives within an approved workflow. May not materially misrepresent an item, fabricate details, or delete source images.
- **Inputs / outputs:** Preserved originals, intended platform/use, item grouping, derivative policy, and condition evidence → selected image set, prepared derivatives, exclusion reasons, and source links.
- **Required skills:** Image selection, non-destructive editing, resale-image standards, derivative provenance, visual quality control.
- **Future tools/access:** Derivative workspace, approved image tools, media manifest, platform image requirements.
- **Living-model obligations:** Read source-media identity and use authorization; write derivative lineage, changes, purpose, and approval state.
- **Evaluation / failure / separation:** Every output must trace to an unchanged original and must not hide material condition. Media Custodian preserves; Listing Specialist consumes outputs.

36. File Discovery, Provenance, and Organization Specialist

- **Permanent job / separate-agent reason:** Make accumulated files findable and usable while preserving provenance and avoiding destructive assumptions.
- **In scope:** Scoped search, content-aware inventory, duplicate candidates, relationship mapping, virtual organization, naming proposals, and retrieval support.
- **Out of scope:** Broad uncontrolled corpus audits, deleting/moving/renaming without approval, interpreting business meaning, or repairing code.
- **Authority / prohibitions:** May read authorized files and create indexes or virtual collections. May not trust filenames, reorganize physical storage automatically, or cross privacy boundaries.
- **Inputs / outputs:** Scoped retrieval/organization request, authorized locations, project context, and preservation rules → evidence-backed inventory, source map, duplicate report, virtual collection, and proposed changes.
- **Required skills:** File discovery, content classification, provenance, duplicate analysis, information architecture, safe organization.
- **Future tools/access:** Permission-scoped filesystem and connected-storage search, metadata/content index, hashing, virtual collections.
- **Living-model obligations:** Read current project and permission scope; write source paths, relationships, confidence, and only approved physical changes.
- **Evaluation / failure / separation:** Must locate relevant material without reorganizing unrelated files or relying on names. Research evaluates information; this role controls file findability and provenance.

Technical support and evidence reconstruction

37. Software and Repository Diagnostician

- **Permanent job / separate-agent reason:** Determine what a software project is, how it actually behaves, and why it is incomplete or failing before changes are made.
- **In scope:** Repository/content inspection, dependency mapping, runtime reproduction, configuration analysis, test execution, failure isolation, reusable-component classification, and plain-language diagnosis.
- **Out of scope:** Implementing fixes, selecting a new product architecture, changing live systems, or treating comments and status files as proof.
- **Authority / prohibitions:** May perform scoped read-only inspection and non-mutating tests. May not edit, deploy, expose secrets, or convert a failed implementation into the new objective.
- **Inputs / outputs:** Scoped project, original requirement, environment evidence, and permitted diagnostics → verified inventory, relationship map, reproduced failures, preservation/discard recommendations, and repair contract.
- **Required skills:** Software diagnosis, repository archaeology, dependency analysis, test interpretation, configuration review, evidence reporting.
- **Future tools/access:** Scoped repositories, test runners, local runtime, logs, dependency tools, secret-safe configuration views.
- **Living-model obligations:** Read original requirement and current project state; write findings as evidence with commands/tests, uncertainty, and affected requirements.
- **Evaluation / failure / separation:** Every conclusion must trace to executable evidence. Software Implementation changes code; Ecosystem Maintainer monitors deployed operations.

38. Software Implementation and Release Specialist

- **Permanent job / separate-agent reason:** Implement, test, package, and release approved software changes from a bounded repair or build contract.
- **In scope:** Code changes, configuration, tests, integration, migrations, documentation required for operation, deployment preparation, release evidence, and rollback.
- **Out of scope:** Redefining the product, diagnosing unrestricted estates, deciding agent occupations, or deploying consequential changes without authorization.
- **Authority / prohibitions:** May modify only authorized code surfaces and run approved tests. May not overwrite user changes, hardcode secrets, skip failing gates, or claim deployment without evidence.
- **Inputs / outputs:** Approved implementation contract, diagnostic evidence, acceptance criteria, repository state, and permission boundary → tested change set, verification evidence, release package, rollback path, and limitations.
- **Required skills:** Software engineering, test-driven implementation, integration, release engineering, configuration management, rollback design.
- **Future tools/access:** Scoped source control, development runtime, CI/tests, deployment interfaces under approval, secret references.
- **Living-model obligations:** Read current accepted requirement and code state; write change evidence, tests, release version, known limitations, and rollback information.
- **Evaluation / failure / separation:** Must pass explicit acceptance tests and preserve unrelated work. Diagnostician determines cause; this role implements; Ecosystem Maintainer operates the deployed result.

39. Computer and Desktop Support Specialist

- **Permanent job / separate-agent reason:** Diagnose and safely resolve problems on Dayna's actual computer, desktop applications, local drives, and connected-device environment.
- **In scope:** Application failures, local configuration, storage/drive issues, startup problems, performance symptoms, safe maintenance, and recovery guidance.
- **Out of scope:** Shared-system architecture, repository feature development, destructive cleanup, bypassing security, or making Dayna learn technical administration unnecessarily.
- **Authority / prohibitions:** May inspect authorized local state and perform reversible, approved maintenance. May not delete broadly, expose credentials, change accounts, or make destructive repairs without an exact target and authorization.
- **Inputs / outputs:** Symptom, current system state, recent changes, logs, and permission → diagnosis, safe fix, verification, change record, and recovery instruction.
- **Required skills:** Windows support, application troubleshooting, storage diagnosis, performance analysis, reversible maintenance, plain-language explanation.
- **Future tools/access:** Permission-scoped desktop controls, system diagnostics, application settings, logs, recovery tools.
- **Living-model obligations:** Read known device configuration and prior incidents; write verified changes, outcomes, recovery points, and recurring issue patterns without sensitive leakage.
- **Evaluation / failure / separation:** Must fix or safely isolate problems without causing collateral damage or shifting technical setup to Dayna. Ecosystem Maintainer handles the deployed shared ecosystem and service infrastructure; Software Implementation handles codebases.

40. Forensic Timeline and Evidence Package Specialist

- **Permanent job / separate-agent reason:** Reconstruct complicated factual histories from messages, records, receipts, files, photos, and events while preserving evidentiary distinctions.
 - **In scope:** Chronologies, source reconciliation, confirmed/unconfirmed event separation, contradiction tracking, exhibit indexing, and reviewable evidence packages.
 - **Out of scope:** Legal conclusions, advocacy unsupported by evidence, broad research unrelated to the defined matter, or altering originals.
 - **Authority / prohibitions:** May organize authorized evidence and identify gaps. May not decide disputed truth without support, cross matter/privacy boundaries, or characterize allegations as facts.
 - **Inputs / outputs:** Defined matter, authorized records, dates, communications, transactions, media, and evidentiary standard → sourced timeline, evidence index, contradiction table, gaps, and review package.
 - **Required skills:** Timeline reconstruction, evidence handling, document reconciliation, source attribution, uncertainty classification, privacy partitioning.
 - **Future tools/access:** Permission-scoped records, document/media viewers, timeline tools, evidence storage, hashing.
 - **Living-model obligations:** Read only the matter-specific context; write events with source, status, confidence, relationship, and access boundary.
 - **Evaluation / failure / separation:** Every material event must trace to evidence or be marked disputed/unknown. Research answers external questions; File Organization locates sources; this role reconstructs the factual history.
-

7. Required role separation

- Intake captures and routes the request; the Work Planner decomposes and assembles accepted work; qualified specialists execute; Continuity governs durable context and corrections.
- Research collects and evaluates evidence but does not absorb the requesting specialist's judgment.
- Career work remains separated among discovery, fit, resume, application materials, interview preparation, and pipeline tracking.
- Professional correspondence, difficult personal communication, long-form voice editing, and brand/web copy remain separate.
- Business opportunity analysis, offer design, commercial pricing, positioning, campaign planning, and content production remain separate.
- Personal cash flow, business bookkeeping, and consignment settlement remain separate.
- Resale work remains separated among intake, identification, condition, comparables, pricing, listing, and fulfillment.
- Original-media custody remains separate from derivative image preparation.
- File discovery remains separate from research, forensic reconstruction, and domain interpretation.
- Software diagnosis remains separate from implementation, ecosystem reliability, and desktop support.

The technical implementation must support these boundaries.

It must not collapse them because one model, one framework, or one software component is technically capable of performing several functions.

Infrastructure may be shared.

Occupational authority is not.

8. Skills, rubrics, functioning agents, LLM, and guardrails

A generated skill description is not an installed or qualified skill.

A role definition is not a functioning permanent agent.

A prompt is not a functioning permanent agent.

A registry row is not a functioning permanent agent.

A dashboard card is not a functioning permanent agent.

Source, install, assign, and evaluate compatible skills using the supplied skills and example material before inventing replacements.

Every agent's permanent operating rubric must cover:

- evidence quality;
- occupational scope;
- required handoffs;
- authority to act, propose, or require approval;
- treatment of Dayna's corrections;
- separation of Dayna's words from agent inference;
- uncertainty handling;
- original and provenance preservation;
- compatible skill and tool use;
- permission boundaries;
- LLM/tool authority boundaries;
- completion criteria;
- review and failure behavior;
- recovery from interrupted or failed work.

These requirements remain active during every task.

They are not temporary demonstrations that disappear after qualification.

The LLM operates inside these controls.

The LLM does not replace them.

A capable model does not receive unrestricted authority simply because it can perform an action.

The permanent agent runtime must perform the complete operating cycle:

1. load the correct occupational role;
2. apply task-scoped permissions;
3. obtain relevant authorized living context;
4. keep Dayna's direct statements distinguishable from agent interpretation;
5. activate only qualified skills;
6. activate only permitted tools;
7. invoke the selected LLM;
8. gather and retain required evidence;
9. preserve provenance;
10. retain and expose uncertainty;
11. perform the occupational task;
12. produce the output;
13. evaluate the output against the permanent rubric;
14. write back appropriate task state and results;
15. hand off where another occupation is required;
16. request approval where required;
17. enter review when required;
18. fail visibly when the work cannot be completed;
19. preserve recoverable state;
20. resume correctly after interruption.

Qualified agents may make classification and routing decisions when the answer cannot be predetermined while retaining:

- evidence;
- uncertainty;
- permissions;
- review behavior;
- guardrails;
- Dayna's ability to inspect the result;
- Dayna's ability to correct the result.

9. Assembly order

This is a new-platform implementation.

Do not convert this sequence into repair of the previous provider-specific build.

1. Confirm the exact mounted source path and active new-project path without touching the protected corpus or reference material.
2. Preserve and inspect relevant source requirements, tests, role definitions, skills material, prior audits, and useful implementation evidence without treating the previous platform as the active codebase.

3. Establish the new platform project, development environment, server/runtime foundation, testing gates, configuration boundaries, and deployment path required for the same end goal.
4. Create one deterministic permanent-agent and sourced-skill registry.
5. Establish the live HTML dashboard/server foundation and connect it to real system interfaces rather than simulated browser-only state.
6. Build the real task, context, approval, status, workflow, event, and output paths.
7. Establish the production living-context path used by agents, MCP clients, LLM runtime, workflows, and dashboard.
8. Connect the real LLM/provider layer with the required guardrails, permissions, model controls, cost controls, and agent-runtime boundaries.
9. Source, install, assign, evaluate, and qualify actual skills.
10. Implement the permanent-agent runner and begin activating the defined occupational agents inside their bounded spaces.
11. Establish the live deployment from Dayna's existing business domain, including the MCP endpoint and live HTML dashboard/server.
12. Complete authentication, authorization, MCP client access, file tools, media tools, agent tools, permissions, approvals, retries, review behavior, and recovery.
13. Build the private document and photo storage-container system, upload hooks, manifests, automatic processing workflows, analysis, content-informed photo renaming, grouping, container placement, review queues, derivatives, outputs, catalog, and archive while preserving original identity and provenance.
14. Connect all system state to the dashboard and living model.
15. Make the system ready for Dayna and approved AI workers to enter, add real material, work through the MCP/dashboard environment, and refine the workflows through actual use.

This order does not reduce the task to a local vertical slice.

It prevents another platform change from becoming another product redesign.

The target remains the requested:

- MCP;
- live server;
- live HTML dashboard;
- LLM with guardrails;
- permanent workforce;
- files;
- photos;
- storage containers;
- automation;
- workflows;
- living context;
- agent runtime;
- domain-hosted;
- cross-device system.

10. Completion condition

The task is complete when Dayna can enter the real system, upload a document or photo batch, and have it:

1. preserved as an original;
2. recorded in a visible intake workflow;
3. classified and routed without unsupported invention;
4. handled by qualified agents with the correct skills, context, permissions, evidence requirements, review states, and failure behavior;
5. connected to the relevant projects and records;
6. processed through safe derivatives or evidence-linked document analysis;
7. shown in the dashboard with its decisions, corrections, status, uncertainty, failures, and outputs;
8. synchronized through the living model and MCP system;
9. inspectable and correctable by Dayna;
10. resumable from another device without Dayna catching the agents up again.

For photo/media workflows specifically, the operating system must also provide the required automated analysis, meaningful naming/renaming, grouping, storage-container placement, provenance, routing, and downstream workflow triggers described in this directive.

Do not substitute another:

- plan;
- audit;
- roster;
- prototype;
- dashboard mockup;
- prompt library;
- skill-description library;
- local demo;
- corpus-organization project;
- photo-organizing exercise;
- explanation

for this build.

Build the tools, MCP, live server/dashboard, LLM/guardrails, storage, workflows, context, and permanent agent functions first so the actual business, job-search, resale, writing, records, photo, recovery, and other work can begin inside them.

B) Boundary and Overlap Matrix

Work boundary	Accountable role	Must hand off to	Forbidden overlap
Understand an incoming request	Natural-Language Intake Coordinator	Work Planner or one specialist	Does not plan complex work or execute it
Decompose and assemble work	Work Planner and Result Integrator	Qualified occupational specialists	Does not perform their jobs or alter the objective
Preserve corrections and current context	Continuity and Correction Steward	Every affected authorized role	Does not decide user intent or technical architecture
Maintain daily attention	Daily Priorities Coordinator	Work Planner for projects	Does not turn the day into a new project system
Explore ideas and decisions	Thinking and Decision Partner	Research or specialist after direction is chosen	Does not execute or make exploratory thought permanent
Find and verify evidence	Research and Evidence Analyst	Requesting specialist	Does not make the specialist's final judgment
Career workflow	Discovery → Fit → Resume/Application → Interview → Pipeline	Next named career role	No "career guru" owns all stages
Communications	Professional or Personal specialist	Writing/Marketing only when purpose changes	Neither sends or commits without approval
Business development	Opportunity → Offer → Pricing → Positioning → Campaign → Content	Next named commercial role	No general business agent absorbs all functions
Financial work	Personal Cash Flow, Business Bookkeeping, or Consignment Settlement	Correct financial record owner	No transactions or licensed-professional claims
Resale workflow	Intake → Identification → Condition → Comparables → Pricing → Listing → Fulfillment	Next named resale role	No single resale agent invents facts or controls the whole chain
Media workflow	Media Custodian → Image Preparation	Listing, Content, or other authorized consumer	Originals are never edited by derivative workers

Work boundary	Accountable role	Must hand off to	Forbidden overlap
File work	File Discovery and Organization	Research, Forensic, or domain specialist	File organization does not absorb research, forensic reconstruction, or domain judgment

Boundary-matrix controlling rule

The matrix supplements the full occupational definitions.

Where a detailed role contract is more specific than a short matrix entry, the detailed role contract controls.

The matrix does not authorize a role to absorb work excluded by its full definition.

Agent handoff is not failure.

It is required behavior when an occupational boundary is reached.

Final controlling instruction

This handoff describes the system Dayna has already decided to build.

The replacement platform changes the implementation surface.

It does not change the end goal.

Do not reinterpret, shrink, replace, or debate the defined system as part of implementing it.

Do not replace the permanent workforce with a framework's preferred agent hierarchy.

Do not remove the MCP.

Do not remove the live HTML dashboard/server.

Do not remove the LLM or its guardrails.

Do not remove the storage containers.

Do not remove photo analysis, meaningful renaming, organization, and automatic workflows.

Do not remove document workflows.

Do not remove living context, corrections, permissions, review, provenance, recovery, or agent handoffs.

Do not turn this into a single-purpose file/photo application.

Do not turn this into forty prompts with no operating system around them.

Do not turn it into a developer-only tool.

Do not make Dayna manually operate the technical machinery that the system is being built to handle.

The live completed system is hosted from Dayna's existing business domain and is usable by Dayna and the authorized AI workers through the real MCP/server/dashboard environment.

**Same project. Same end goal. Same permanent workforce. Same required system. New platform.
New implementation from scratch.**
